                                                                                                                                                                                                                                                                                                                                                            The present sequence represents the OX40/Fc fusion protein that contains the extracellular domain of mouse OX40 fused to the mutated Fc region of the human IgGl antibody. The fusion protein was used for detecting cDNA clones encoding an OX40 ligand. The invention claims for a murine OX40-L cytokine (AAW48975) that binds to the murine T cell antigen, OX40. The OX40-L protein is claimed to be useful for co-stimulation of T-cell production and in binding assays for detecting OX40 or its homologues. The OX40-L protein is also claimed to generate a TH-2 immune response.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to a method for treating conditions leading CC to bone loss. The method comprises administering a purified and isolated osteoprotegerin (OPG) protein (AAF57836-AAF57838 and AAB66974-AAB66976) CC in conjunction with other substances such as tumour necrosis factor-alpha CC (TNF-alpha) inhibitors, interleukin (II)-6, -8 and -18 inhibitors, ICE CC modulators, fibroblast growth factor (FGF)1-10 modulators and/or platelet CC activating factor (PAF) antagonists. The method is useful for treating CC conditions leading to bone loss such as rheumatoid arthritis, multiple CC sclerosis, osteoporosis, osteopyelitis and asthma. The method is also CC useful for treating inflammation, systemic lupus crythematosus (SLE) and graft-versus-host disease (GvHD). Other diseases that can be treated CC include acute pancreatitis, Alzheimer's disease, anorexia, CC annear, diabetes, endometriosis, fever, glomerulonephritis, hyperalgesia, CC inflammatory bowel disease, ischaemia, pain, Parkinson's disease, concared concertion and septic shock. The present sequence was used in a sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The extracellular domain of OX40 is its ligand binding domain. The CDNA (AAV32640) encoding OX40 extracellular domain was used in the construction of the chimeric OX40/Fc CDNA (AAV32640). The invention claims for a murine OX40-L cytokine (AAW48975) that binds to the OX40 murine T cell antigen. The OX40-L protein is claimed to be useful for co-stimulation of T-cell production and in binding assays for detecting OX40 or its homologues. The OX40-L protein is also claimed to generate a TH-2 immune response.
                                                              New compounds designed from a binding loop of a tumour necrosis factor receptor - are capable of inhibiting the biological activities of tumour necrosis factor, e.g., in treating inflammor autoimmune diseases

a tumour necrosis

osteoclastogenesis and bone resorption. Osteoclastogenesis and bone resorption inhibiting peptide analogues from the present invention have osteopathic, cytostatic, antirheumatic, antiarthritic, antiinflammatory

and are

factor (TNF) -

immunomodulatory activities,

The present invention describes a method for inhibiting

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         responses, septic shock, cachexia, autoimmunity, graft-versus-host disease, skin allergic reactions, immune complex disease, transplantation rejection and malaria. Administration is, e.g. oral transdermal, transmucosal, pulmonary, subcutaneous, intravenous or intramuscular. Parenteral dosage is 0.1-5 mg/kg/day. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 factor receptor (TNF-R) superfamily member. The compounds are est designed from a binding loop of TNF-R p55. They are capable of inhibiting TNF binding to its cellular receptors and may be used inhibit the biological activities of TNF. They may be used in triple the biological activities of TNF. They may be used in triple the second conditions such as acute and chronic inflammatory the second conditions such as acute and chronic inflammatory.
                                                                                                                                                                                                                                                                                                                                                                                                                                                   Paget's disease; metastatic bone disease; rheumatoid arthritis; periodontal disease; modulating dendritic cell maturation; T cell proliferation. The present invention describes the human TRID protein (tumour necrosis factor (TNF) related apoptosis inducing ligand (TRAIL) receptor without intracellular domain, also referred to as tumour necrosis factor receptor 5 (TNFR-5 or TRS)). TRID has cytostatic, immunosuppressive, nootropic, neuroprotective, antiviral, antiinflammatory, anticonvulsant, antivitaes, and can be used in gene therapy. The TRID polynucleotides are useful for detecting complementary polynucleotides. TRID proteins an polynucleotides are useful in the treatment of tumours, resistance to parasite, bacteria and viruses, restenosis and graft versus host disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; tumour necrosis factor receptor 5; TRID; TNFR-5; TRS; nootropic TRAIL receptor without intracellular domain; diagnosis; cytostatic; tumour necrosis factor related apoptosis inducing ligand; vasotropic; immunosuppressive; neuroprotective; antiviral; antiinflammatory; anticonvulsant; antiparasitic; cardiant; anti-HTV; antiparkinsonian; gene therapy; restenosis; graft versus host disease; tumour; cancer; apoptotic cell death related disease; autoimmune disorder;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              disease, and modulating dendritic cell maturation, T cell proliferation, and/or CD40 receptor systems. The present sequence represents an extracellular Cys-rich domain of a tumour necrosis factor receptor (TNF-R) superfamily member, which is used in the exemplification of the present invention.
                                                                                                                                                                                                                  related activation induced cytokine (TRANCE)/ receptor activator of NF-kappaB ligand (RANK) inhibitors. The method is useful for treating diseases characterised by bone loss such as osteoporosis, Paget's disease, metastatic bone disease, rheumatoid arthritis or periodontal
                                                                                                                                                                                       Disclosure; Fig 2;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAB36700 standard; Protein; 415

The antibodies which bind TRID polypeptides are useful for treating and/or preventing diseases associated with increased or decreased apoptotic cell death. The TRID polynucleotides, proteins, antibodies, agonists and antagonists are useful in the diagnosis, treatment or prevention of: (a) cancer; (b) autoimmune disorders; (c) diseases associated with increased apoptosis; (d) cardiovascular disorders; and (e) viral infection. The present sequence represents a tumour necrosis factor receptor used in comparison with TRID in the exemplification of the present invention.

RANK is a member of CC the tumour necrosis factor family. A soluble RANK may be used for CC inhibiting activation of NF-kB, by contacting a cell expressing membrane CC associated RANK with a soluble RANK which binds to RANK ligand (RANKL). CC RANKL polypeptides can activate RANK and can be used to induce maturation CC admitted cells and enhance their allo-stimulatory capacity, thereby CC augmenting an immune response. The soluble RANK polypeptide composition CC may also be used for regulating an immune or inflammatory response. CC Inhibition of NF-kB by RANK antagonists may be useful in ameliorating CC negative effects of an inflammatory response that result from triggering CC of RANK, e.g. in treating toxic shock or sepsis, graft-versus-host creations, or acute inflammatory reactions. They can also be used in CC adjunct therapy for disease characterised by neoplastic cells that CC express RANK. RANKL polypeptides can also be used to identify inhibitors of RANK and thus inhibitors of an inflammatory response, and also for CC chemotherapy or the presence of high levels of TWF-alpha. The products can also be used to incomplace the presence of high levels of TWF-alpha. The products

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This represents a partial sequence of the polypeptide RANK (receptor activator of necrosis factor-kappaB (NF-kB)). RANK is a member of the tumour necrosis factor family. Host cells transformed or transfected with an expression vector comprising the RANK encoding nucleic acid can be used to produce recombinant RANK protein. The soluble RANK may be used for inhibiting activation of NF-kB, by contacting a cell expressing membrane-associated RANK with a soluble RANK which binds to RANK ligand (RANKL). The soluble RANK polypeptide composition may also be used for regulating an immune or inflammatory response. Inhibition of NF-kB by RANK antagonists may be useful in ameliorating negative effects of an
                                                                                                                                                                                                                                                                                                                                                                                                                             (RANKL). The soluble RANK polypeptide composition may also be used for regulating an immune or inflammatory response. Inhibition of NF-kB by RANK antagonists may be useful in ameliorating negative effects of an inflammatory response that result from triggering of RANK, e.g. in treating toxic shock or sepsis, graft-versus-host reactions, or acute inflammatory reactions. They can also be used in adjunct therapy for disease characterised by neoplastic cells that express RANK. The products can also be used for detection and drug screening.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New isolated receptor activator of necrosis factor-kappa for, e.g. developing products for regulating an immune on inflammatory response, treating toxic shock or sepsis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 02-JUL-1998

                                                                                                                                                                   NOTE: This is a 'working draft' sequence. It currently consists of 4 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified cDNAs from a pool of 5,000 clones made from the same library (clonexDs 1057416-1061255, and 1144584-1145351).

                                                                                                                                                                                                                                                                                                                                                                                                                                                       double-stranded cDNA was ligated to Eco RI adaptors (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of the modified pT7T3 vector. Library went through one round of normalization. Tissue samples provided by Dr. Brian Dieckgraefe (Washington University, dieck@im.wustl.edu); colonic mucosa represents a range of disease involvement from moderate to severe Crohn's disease; samples include both perforating (fistulas) and non-perforating samples. Library constructed by Bento Soares and M. Fatima Bonaldo.
